## Potentilla Blooms Spring till Fall

(Shrubby Cinquefoil, golden hardhack)

*Potentilla fruticosa* is a hardy, deciduous shrub that grows up to 3 feet tall and 3-4 feet wide. They are native to cool temperate and subarctic regions of the northern hemisphere. Potentilla is a member of the rose family, and is also a relative of the strawberry!

Its hardiness zones are 2 to 8. It is a beautiful ornamental shrub that is often seen in shopping malls because of its easy care requirements. The Potentilla plant forms a mound of gray-green leaves and is covered with blooms that last from spring to fall.

It is a slow grower and is a perfect plant for landscapes, shrub borders, rock gardens and rock

walls. The flowers are buttercup shaped with 5 petals. The most popular colours are white, yellow, pink and tangerine. Potentilla plants attract butterflies and native bees.

## Varieties to Plant

There are many varieties to grow, but the most popular are Abbotswood (white), Goldfinger (yellow), Princess (pink), Tangerine (orange) and Yellow Gem (yellow).

## Preferred Conditions

Potentilla are extremely easy care plants that prefers full sun to part shade, well drained average soil with a pH between 6.8 and 7.2. They are drought tolerant. Compost should be applied in late spring, but do not over fertilize.

## Care and Pruning

Prune lightly in the spring to shape plant and encourage flowers. Older plants can be pruned up to a third and you should cut out the old wood.

Cultivating is done best by soft wood cuttings and seeding.

## Problems you Might Encounter

Problems are few but potentilla may develop powdery mildew, rust, or fungal leaf spot. They can be attacked by aphids, or spider mites.
